Outline

Introduction

- Conceptual framework
- Program
- Experimental design
- Results
- Cost Effectiveness

Conclusion

Crepon, Duflo, Gurgand, Rathelot, Zamora

- High unemployment: a promising labor market policy is job placement assistance (Card Kluve Weber, 2010)
 - An important criticism against the existing evaluations of these programs: gains can be offset by displacement effects (queue-jumping)
 - Displacement effects are hard to estimate: requires exogenous variation of the proportion of treated

A D > A B > A B
 A

- We take advantage of a large-scale search assistance program which was implemented in France in 2007 (targeted half of administrative regions)
- Two-step RCT: randomly assign the proportion of treated to areas; randomly assign treatment status to individuals within areas

<ロ> <四> <日> <日</p>

Results preview

- The program increases the durable employment rate of treated wrt untreated individuals
- There exist large externalities that reduce significantly the positive impact of the program
- Externalities appear to be larger when labor market conditions are weaker

A D > A D > A D

Outline

Introduction

Conceptual framework

Program

Experimental design

Results

Cost Effectiveness

Conclusion

Crepon, Duflo, Gurgand, Rathelot, Zamora

Conceptual framework

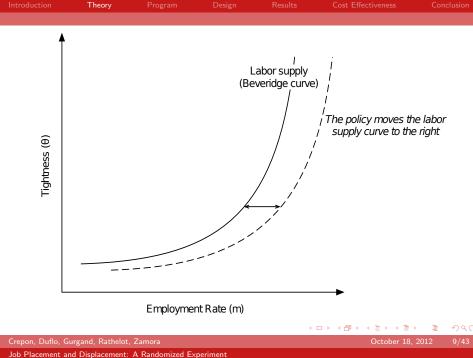

- When should we expect externalities to occur?
- When should we expect these externalities to be stronger?
- Matching model inspired by Michaillat (2012) and Landais, Michaillat, and Saez (2012)
 - Key assumption is that the technology of production exhibits decreasing return in labor
 - Direct extension of the idea that the number of job available is given
 - Very different mechanism compared to the standard matching model

<ロ> <四> <日> <日</p>

Beveridge curve

- Beveridge curve expressed as a increasing mapping between the market tightness and the employment rate
- The program increases the search efficiency of treated job seekers: shifts the curve to the right

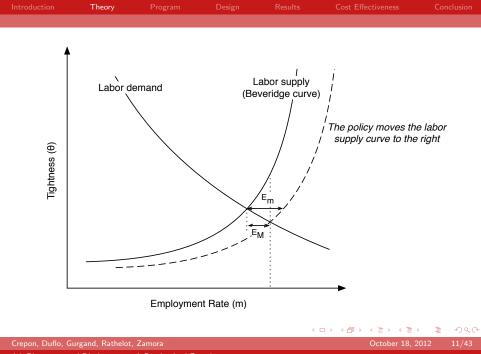

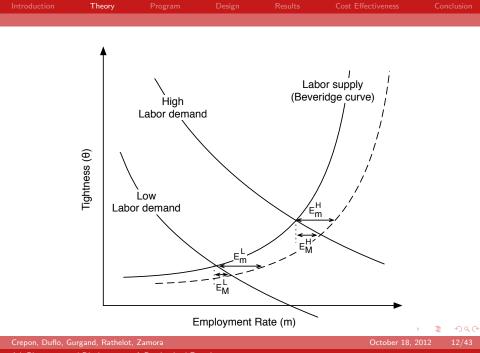

Labor demand

- Key assumptions:
 - decreasing return to scale in the technology of production $Y = AL^{\beta}$
 - sluggish adjustment in the wage
- Labor demand equation: decreasing mapping between the market tightness and the employment rate
 - Search costs associated to opened vacancies enter the labor demand in the same way as wages
 - If wages are fixed an increase in employment has to be associated with a decrease in market tightness so as to reduce the search cost

< ロ > < 回 > < 回 >

Predictions

- The magnitudes of displacement and net effects depend on the strengh of labor demand
 - Displacement effects are large in weak labor markets
 - Micro effects are large in weak labor markets
 - Macro effect are small in weak labor markets

	Program	Design		

Outline

- Introduction
- Conceptual framework

Program

- Experimental design
- Results
- Cost Effectiveness

Conclusion

Crepon, Duflo, Gurgand, Rathelot, Zamora

A program for young and educated job seekers

- Youth unemployment an important issue in many countries (18% in the US, 23% in France or the UK, 36% in Italy, more than 50% in Spain and Greece)
- In 2007, new job search assistance program for 10,000 young job seekers
 - Less than 30 years old
 - Unemployed for more than 6 months (or cumulating more than 12 months over the last 18 months)

October 18, 2012

Diploma after 2 years of college

Counseling firms

- Private counseling firms contracted with the objective to bring job seekers back to long-term jobs (idea of stepping stone)
- Payment conditional on objectives:
 - ▶ 25% if the job seeker enrolled
 - ► 40% if the job seeker signed a stable contract within less than 6 months
 - ▶ 35% if the former job seeker is still employed six months after the job has been found

- ▶ Total fee around 1800 euros
- Compare to an order of magnitude of 350 euros for a six month standard counseling program by the PES service

Conclusion

Crepon, Duflo, Gurgand, Rathelot, Zamora

Two-step randomization

- 1. At the local employment agency (LEA) level:
 - One LEA in each city of more than 30,000 inhabitants
 - Partition 235 LEAs into 47 homogenous quintuplets
 - Randomly assign within each quintuplet the assignment proportions 0%, 25%, 50%, 75% and 100%

Data collection

- PES administrative files: contact details, main characteristics, job sought
- Counseling firms administrative files: identifying who took up
- Endline surveys: 8, 12, 16 and 20 months after random selection
 - ▶ Response rate close to 80% (quite good for such a population)
 - Well balanced between treated vs. control populations
- Focus:
 - Outcome: long term contract or fixed-term contract of at least 6 months, 8 months after random assignment : contractual outcome for private operators
 - Population: individuals that were unemployed at the time of program assignment

Pooled reduced form

$$y_{ic} = \alpha_1 + \beta_1 Z_{ic} P_c + \delta_1 P_c + X_{ic} \gamma_1 + \omega_{ic}$$

- ► P_c is a dummy variable for market (*cities*) where the program has been developed
- Z_{ic} a dummy variable for being assigned to treatment in these areas
- ▶ β₁ is the difference between being assigned to treatment and to control in a treated area
- δ_1 is the effect of being untreated in a treated area
- ▶ β₁ + δ₁ is the net effect of program assignment: difference between treated and super control individuals

Pooled IV regression

$y_{ic} = \alpha_2 + \beta_2 T_{ic} P_c + \delta_2 P_c + X_{ic} \gamma_2 + \omega_{ic}$

 β₂ is the difference between being treated or being untreated in a treated area

- δ_2 is the effect of being untreated in a treated area
- ▶ β₂ + δ₂ is the net effect of treatment: being treated in a treatment area vs being in a control area
- However requires assumptions displacement effect homogeneous between compliers and never-takers
- To be taken with caution not our main result

	Design	Results

3

Other outcome variables

• Earnings : no significant effect.

- Informative to notice that there is no earning effect : alternative explanation of displacement effect point to wage increase for the treated, making vacancies less profitable. No evidence of such effect here
- Longer term employment outcomes (employment at 12, 16 or 20 months): no significant effect.
 - Real policy issue: most ALMP assume stepping stone effect. Experience gathered as an effect of policy should improve durably employability of program beneficiaries. No such effect here

Labor market conditions and externalities

- Prediction: externalities should be larger when labor market conditions are weaker
- Interact the program and the externalities with dummies indicating whether labor market conditions are weak or strong
 - some areas experience higher unemployment rates
 - some cohorts have been more affected by the 2008 recession than others : last cohorts assigned to the program, April ti July 2008

Program

Experimental design

Results

Cost Effectiveness

Conclusion

Crepon, Duflo, Gurgand, Rathelot, Zamora

Difficult to perform a real **cost benefit analysis** because of poor wage and UI data Still difficult but easier to perform **cost effectiveness analysis**

Based on the employment profile in the super control group and the profile in assigned to treatment and to control groups, compute the marginal cos of one treated to be around 600 euros

Interesting to compute the number of LT jobs found by treated, by untreated and the net number of jobs for 100.000 euros invested in the program1000 individuals assigned to the treatment

・ロト ・回ト ・ヨト

October 18, 2012

Do the same for 1000 individuals assigned to the treatment

Introduction		Design	Cost Effectiveness	

Results show that for 1000 treated:

- ▶ 36 jobs are found by the treated due to the program
- 48 are not found by the control due to program implementation
- making a net number of jobs of -12 in area where the program has been developed

Similarly, for 100.000 euros invested in the program:

- ▶ 6 jobs are found by the treated due to the program
- ▶ 8 are not found by the control due to program implementation
- making a net number of jobs of -2 in area where the program has been developed

< 🗇 🕨 🔸

If these computations had been done based on an evaluation ignoring externalities we would have obtained a very different picture

 for 1000 treated we would have conclude that 57 of them had found a job due to the program

< ロ > < 回 > < 回 >

October 18, 2012

▶ for 100.000 euros invested in the program 10 treated would have found a job due to the program

Outline

Introduction

Conceptual framework

Program

Experimental design

Results

Cost Effectiveness

Conclusion

Crepon, Duflo, Gurgand, Rathelot, Zamora

	Design		Conclusion

Conclusion

- Unique opportunity to identify both direct program and displacement effects, using a two-step randomization design
- Positive effects of the program on the probability to hold a long-term contract 8 months after assignment
- Among men, evidence for displacement effects: the program came at the expense of the untreated job seekers that belonged to same labor markets
- Displacement effects are stronger in weaker labor markets
- Net effect is a small non significant reduction of 2 in the number of job placement for an investment of 100.000 euros

< 17 ▶

October 18, 2012

Even ignoring displacement effects would have lead to an evaluation of just 10 job placements

Conclusion

- On the methodological side point to the interest of randomized evaluation
 - Need of evidence in the effect of programs
 - Also show the interest in evaluation starting from a policy/research questions: are there displacement effects? and to build the design and the experiment so as to be able to answer that question : "smart experiment"
- On the policy side results not so much in favor of counseling programs, especially in weak labor market
 - Call on the opposite to look at policies fostering demand
 - Reduction in the cost of vacancies : offering matching services to firm

- Well in line with the predictions of the matching model developed
- Look at firm outcomes: vacancies, hire, fire, quit...
