

Current Data and Indicators

REGIONAL LABOUR MARKET FORECASTS // September 2021

Jörg Heinig | Oskar Jost | Anja Rossen | Duncan Roth | Antje Weyh

The following pages present forecasts by the Institute for Employment Research, Germany (IAB) of the number of people in employment subject to social security contributions, the number of unemployed, the number of unemployed in the Social Code II and III systems and the number of people who are able to work and are eligible for benefits for various regions as well as the unemployment rate. Until the issue 1/2015, this forecast was published as "Regional Forecasts of Unemployment and Employment in the German Federal States and Labour Market Districts". At the IAB, the calculations are carried out in the Regional Research Network.

Content

1	Methodology	2
2	Employment in the Federal States yearly average	3
3	Employment in the Labour Market Districts yearly average.....	4
4	Employment in the Labour Market Districts percentage change from 2021 to 2022.....	10
5	Unemployment in the Federal States yearly average.....	11
6	Number of Unemployed in the Social Code II System ¹⁾ in the Federal States yearly average	12
7	Number of Unemployed in the Social Code III System ¹⁾ in the Federal States yearly average	13
8	Unemployment in the Labour Market Districts yearly average	14
9	Unemployment in the Labour Market Districts percentage change from 2021 to 2022	20
10	Unemployment Rates 2022 in the Labour Market Districts in percent.....	21
11	People Capable of Working and Eligible for Benefits ¹⁾ in the Federal States yearly average	22

1 Methodology

The forecasts for the number of employed subject to social security contributions, the number of unemployed and those capable of working and eligible for benefits are carried out in a three-step process:

1. First, nine different time-series models are estimated. In two of these models, only former values of the dependent variable are included. These models adapt best to the short-term development in a region if there are large fluctuations in the region or there is no clear pattern in the recent past. Two further models decompose the time series to differentiate between level, trend, seasonal and business-cycle influences. The advantage of these two models is that they have a high and robust forecast quality if the time series has a regular and clearly identifiable long-term pattern. In order to profit from the advantages of both types of models, further models were constructed which use a combination of these two approaches. Especially in the case of relatively small regional units, as is the case with the labour market districts, it is likely that regional interdependencies play an important role. Such spatial interdependencies are accounted for in three further models. Two of these treat employment, unemployment and the number capable of working and eligible for benefits as separate variables whereas the third model (first used in March 2011) also accounts for the dependencies between the unemployed (at their place of residence) and the employed (at their place of work). The models with spatial autocorrelation were developed at the IAB in order to improve the forecast accuracy. The last model, a stock-flow approach, uses the information that in- and outflow of workers provide about the future level of (un)employment. These models yield especially good forecasting results during turning points.
2. In order to take the pros and cons of the different models used in the first step into account, an average of the models is calculated in a second step. However, in this so-called pooling, in each region only those models are included whose forecasts have a relatively small deviation from the forecast for Germany. At the same time, in order to control for international and national influences, we adjust the regional forecasts to match the values for the national forecast that take these (inter)national dependencies into account. Hence, the national forecast is a further explanatory variable in our pooled model for every region. The current forecast is based on those in the IAB-Kurzbericht 20/2021 (in German only).
3. In order to verify the validity of the models, in a third step the results are compared with assessments at the ten Regional Offices of the IAB. In this step, it is possible to take important unique events in a region into account. Thus, regional expertise is contained in the forecasts.

In addition to the forecasts of the yearly averages, we also present unemployment rates. Unlike the official unemployment rates published by the Federal Employment Agency which are based on the number of people in the civilian labour force, the rate published here is based on an estimate of the number of civilian salaried employees. Hereby, we take the expected change in unemployment and employment subject to social security contributions into account, but hold the number in all other employment types, for example, mini-jobs or civil servants constant.

By definition, forecasts are uncertain. For this reason, lower and upper bounds are calculated so that the future true values lie within this interval with a probability of roughly 66%. Because the underlying regional forecast model differs from the one used for the national forecasts, the statistical uncertainty and hence the lower and upper bounds differ between the two. A more complete explanation (in German only) of the methodology used can be found in:

Bach et al. (2009): Der deutsche Arbeitsmarkt – Entwicklungen und Perspektiven. In: Institut für Arbeitsmarkt- und Berufsforschung, Nürnberg (Ed.), Handbuch Arbeitsmarkt 2009, (IAB-Bibliothek, 314), Bielefeld: Bertelsmann, p. 64-78.

Thuringia	797,600	800,700	788,400	813,000		0.4	-1.2	1.9
Germany (western/eastern/total)¹⁾								
Germany, western	27,610,000	28,087,000	27,799,000	28,374,000		1.7	0.7	2.8
Germany, eastern	6,254,000	6,328,000	6,256,000	6,400,000		1.2	0.0	2.3
Germany, total	33,864,000	34,415,000	34,056,000	34,774,000		1.6	0.6	2.7

¹⁾ Values for Germany (western/eastern/total) are rounded off to the nearest 1,000. Due to rounding off, the sums for Germany (western/eastern/total) may diverge slightly from official statistics. Due to methodological differences, the lower and upper bounds presented here are not comparable with those in the IAB-Kurzbericht 20/2021.

Total values correspond to those in the IAB-Kurzbericht 20/2021.

Source: Forecasts are based on data of the Federal Employment Agency. Time-span: January 1993 to June 2021.

¹⁾ Due to rounding off, differences between the sum of the labour market districts and Germany can occur.

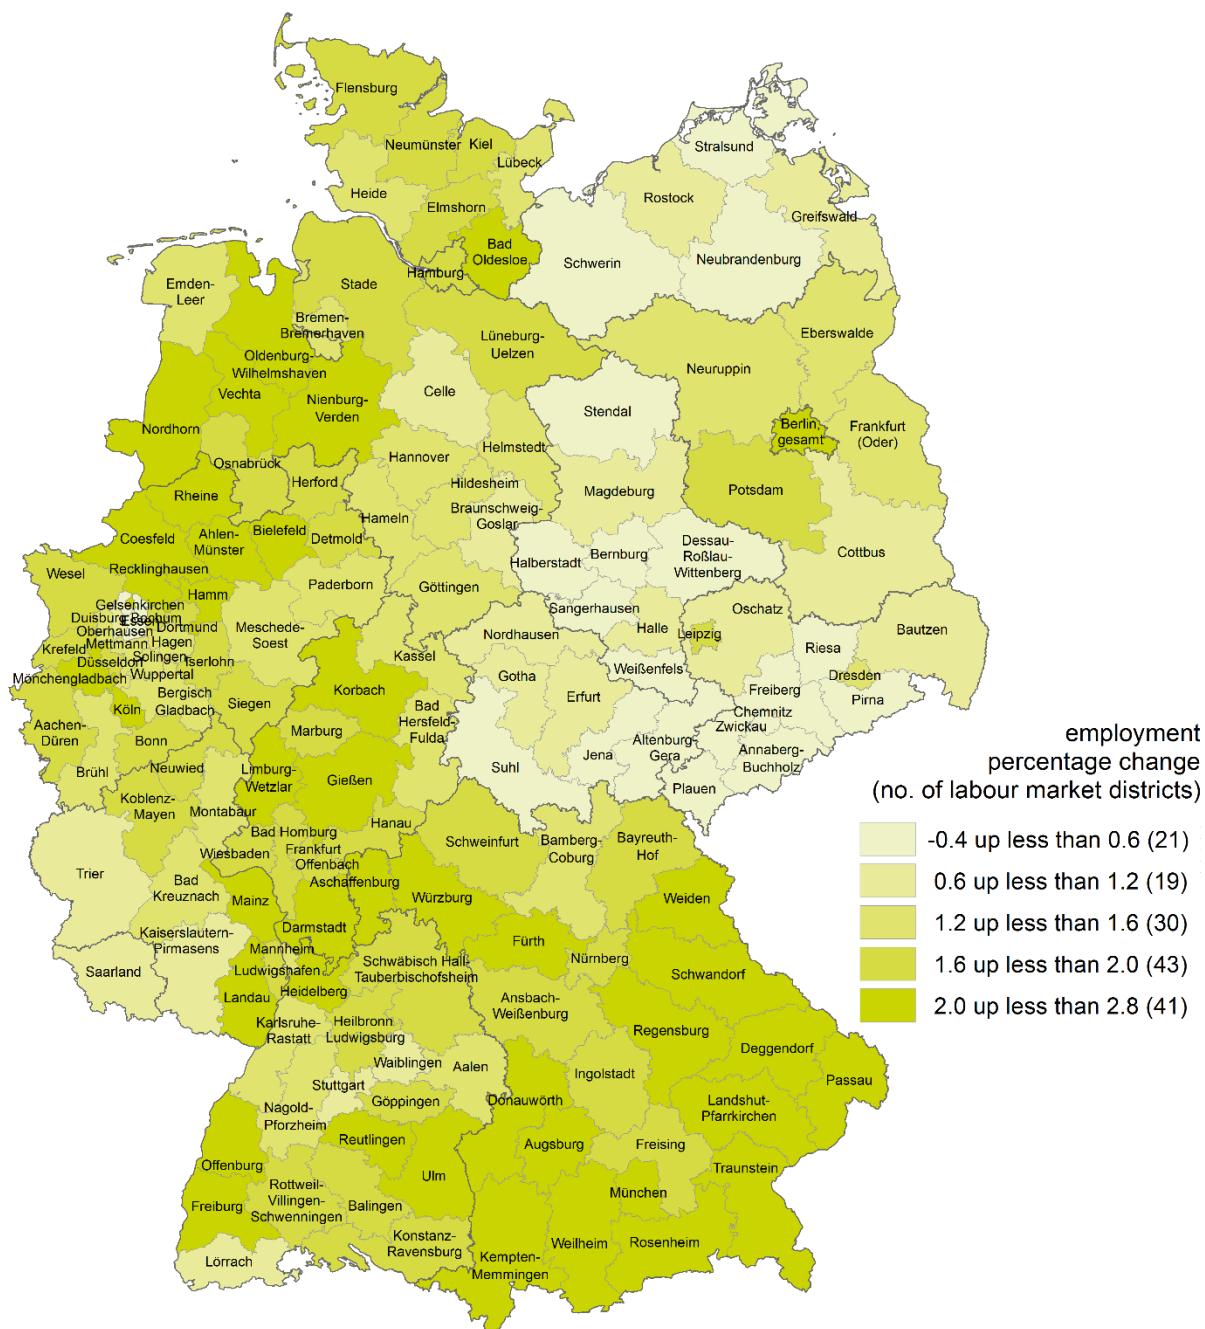

²⁾ The statistical uncertainty which is represented in the lower and upper bounds is also affected by the size of a region. This means that the relative uncertainty of labour market districts is generally higher than for the Federal States. Therefore, the sums of the lower and upper bounds do not correspond to the values for the Federal States. The values for Germany (western/eastern/total) shown here are those from the results of the sum of the Federal States.

³⁾ Values for Germany (western/eastern/Total) are rounded off to the nearest 1,000.

Total values correspond to those in the IAB-Kurzbericht 20/2021.

Source: Forecasts are based on data of the Federal Employment Agency. Time-span: January 1993 to June 2021.

4 Employment in the Labour Market Districts percentage change in yearly average from 2021 to 2022

September 2021

¹⁾ Due to rounding off, differences between the sum of the labour market districts and Germany can occur.

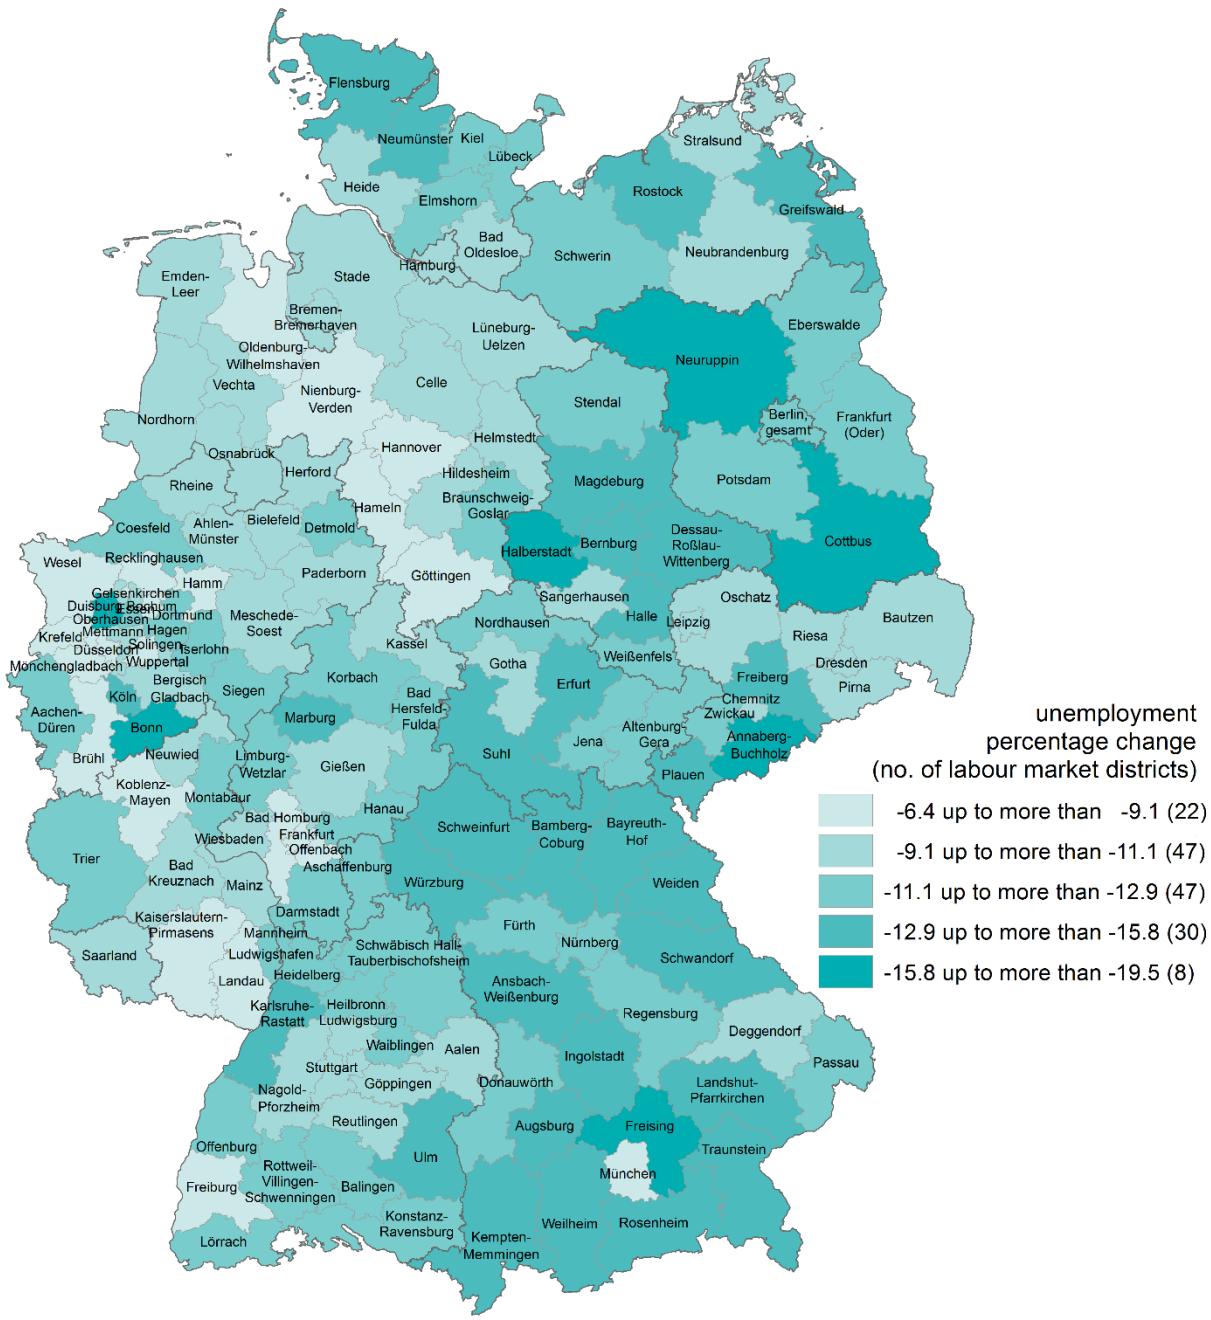

²⁾ The statistical uncertainty which is represented in the lower and upper bounds is also affected by the size of a region. This means that the relative uncertainty of labour market districts is generally higher than for the Federal States. Therefore, the sums of the lower and upper bounds do not correspond to the values for the Federal States. The values for Germany (western/eastern/total) shown here are those from the results of the sum of the Federal States.

³⁾ Values for Germany (western/eastern/Total) are rounded off to the nearest 1,000.

Total values correspond to those in the IAB-Kurzbericht 20/2021.

Source: Forecasts are based on data of the Federal Employment Agency. Time-span: December 1997 to August 2021.

9 Unemployment in the Labour Market Districts percentage change in yearly average from 2021 to 2022

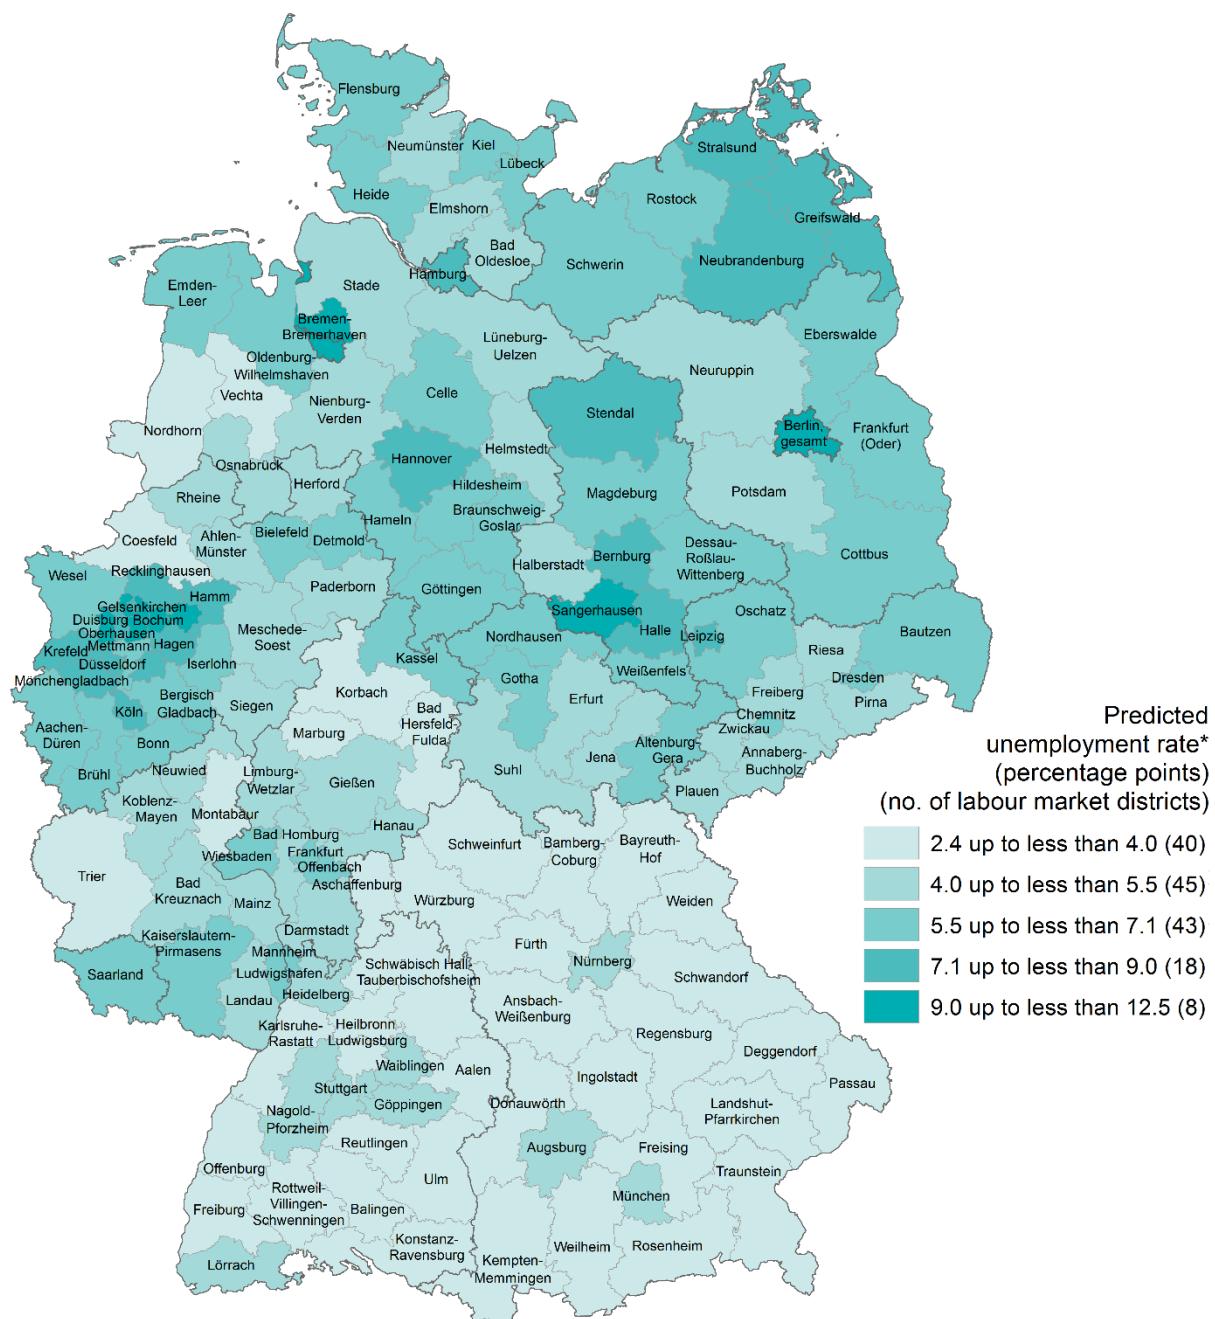

September 2021

Basis for the figure: GeoBasis-DE/Federal Agency for Cartography and Geodesy 2021;
