Tasks, technology and trade

Tasks, technology and trade

Semih Akçomak, Lex Borghans, Bas ter Weel

T.A.S.K.S Workshop, Nuremberg, 17-18 May

Modern production

Modern production

- What are the effects of trade in tasks on changes in employment?

- Three goals
 - ▶ Present a framework to analyse trade in tasks
 - ▶ Find empirical body for the framework
 - ▶ Document developments in the Netherlands

Approach

■ Three levels and decisions

Level	Decision
▶ Workers	Separate tasks
▶ Firms	Outsourcing
▶ Space	Bound by local demand

■ Offshoring is possible if

- ▶ Tasks can be separated from the worker
- ▶ Firms can outsource the tasks to other firms
- ▶ There is no local demand binding tasks to the country

-
- *Enquete Beroeps Bevolking and Sociaal Statistisch Bestand*
 - ▶ Occupations, wages, etc.

 - British Skills Survey
 - ▶ 33 job tasks

 - Input-output tables
 - ▶ Offshoring and outsourcing measures

■ Task-occupation wage differential

- ▶ Absolute difference between occupation and task wage is the potential productivity advantage from unbundling tasks

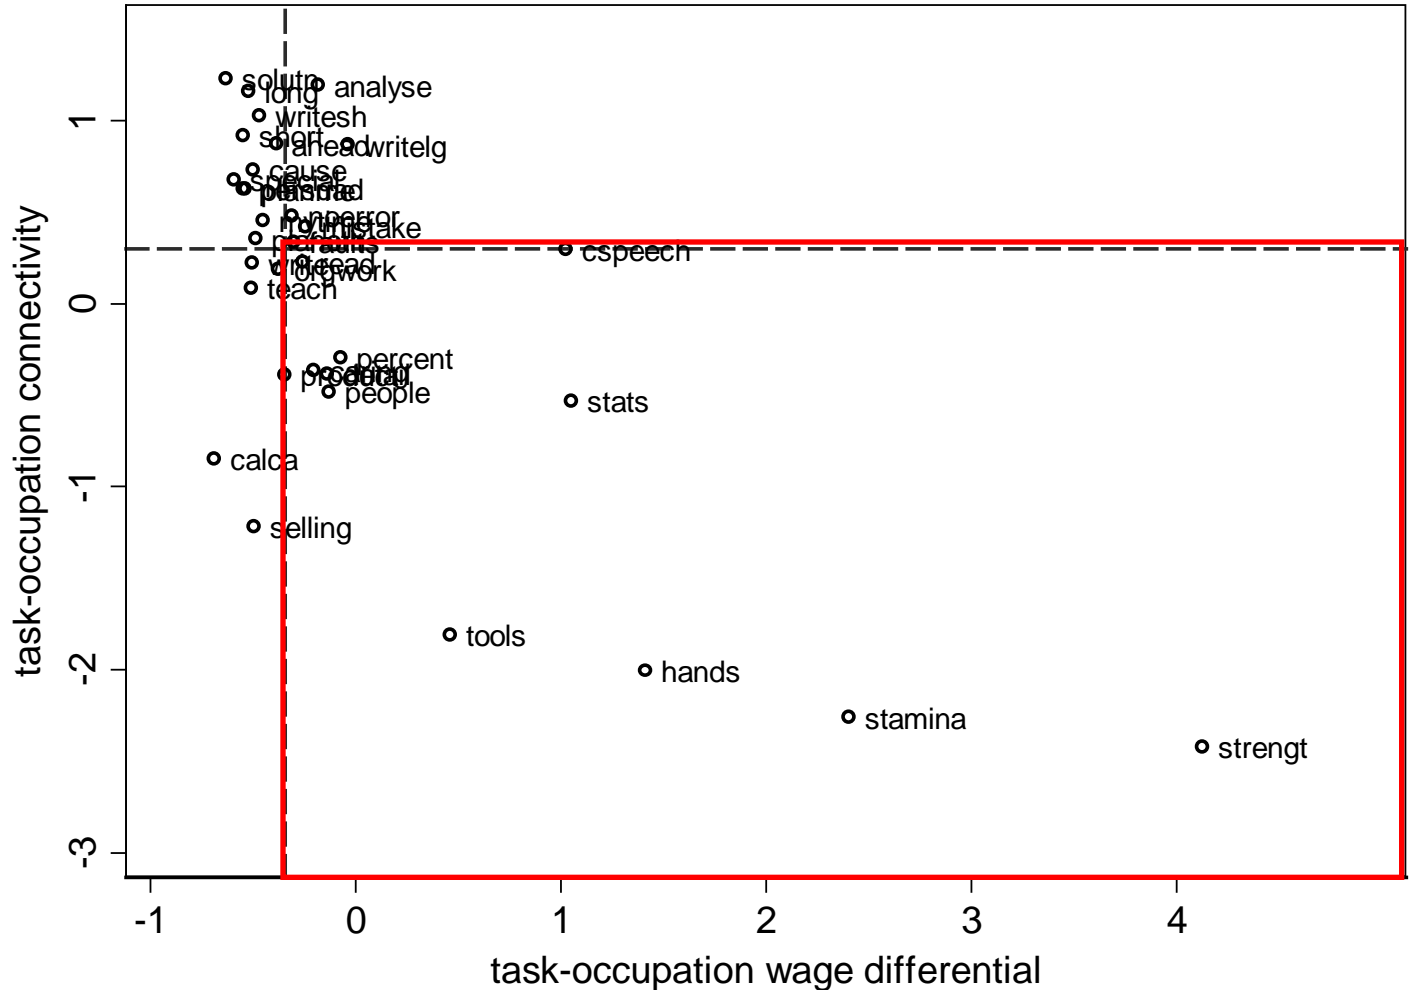

$$towd_{ij} = |w_i - w_j|$$

■ Task-occupation connectivity

- ▶ Prediction of the presence of task X given the presence and importance of task Y

$$toc^{j,i} = \sum_{jj \neq j} c_{j,jj} m_{jj,i}$$

Connectivity and wage differential

Changes in task importance

	(1)	(2)	(3)	(4)
Dependent variable	Change in task importance 1997-2006, all tasks	Ten least important tasks	Middling important tasks	Ten most important tasks
task-occupation connectivity 1997	3.048*** (0.485)	2.820*** (0.843)	2.407*** (0.474)	1.106** (0.548)
task-occupation wage differential 1997	-0.661*** (0.290)	-0.754*** (0.221)	-0.211 (0.242)	-0.087 (0.374)
task importance 1997	-1.169*** (0.149)	-1.369*** (0.154)	-1.877*** (0.097)	-1.529*** (0.117)
constant	5.622*** (1.106)	0.360 (1.033)	-0.299 (0.854)	3.977*** (1.483)
Observations	1,188	360	468	360
R-squared	0.563	0.589	0.757	0.780

Contestability

Employment changes

Dependent variable: Change in employment, 1996-2005	(1) OLS	(2) OLS	(3) WLS	(4) WLS
task-occupation connectivity	0.075** (0.030)	0.153*** (0.048)	0.058** (0.023)	0.075** (0.032)
task-occupation wage differential	0.003 (0.024)	0.032 (0.026)	0.067** (0.026)	0.083*** (0.028)
education 1996		-0.084 (0.059)		-0.011 (0.044)
log employment 1996		0.029 (0.027)		0.031 (0.022)
Constant	0.012 (0.029)	-0.173 (0.189)	0.053** (0.021)	-0.183 (0.176)
Observations	36	36	36	36
R-squared	0.168	0.273	0.329	0.370

Predicted and actual changes

■ Task-industry connectivity

- ▶ Prediction of the presence of task X given the presence and importance of task Y

$$tic^{j,r} = \sum_{jj \neq j} c_{j,jj} m_{jj,r}$$

where r indexes 70 industries and j indexes 33 tasks. $c_{j,jj}$ is an element of the correlation matrix of 33 tasks that shows how task j is correlated with other tasks jj at the industry level

■ Task-industry wage differential

- ▶ No differentials other than selection effects. We neglect these

Analysis

- Changes in task importance
 - ▶ Task-industry connectivity correlates positively with changes in task importance

- Changes in employment
 - ▶ Task-industry connectivity correlates positively with changes in employment

Predicted and actual changes

■ Job connectivity

- ▶ Prediction of the presence of job X given the presence and importance of job Y
- ▶ Connectivity at the geographical level is measured based on the distribution of occupations. The measured tasks do not capture geographical variation in economics activities well enough

$$\text{job connectivity}^i = \sum_{ii \neq i} C_{i,ii} M_i$$

■ Job concentration

- ▶ Tradability of jobs: difference between the occupation and population share

$$\text{job concentration} = \sum_{i=1}^n |occ_i - p_i|$$

Concentration and connectivity

Job connectivity, job concentration and employment changes

Dependent variable: Changes in employment, 1996-2005	(1) OLS	(2) WLS	(3) OLS	(4) WLS
job concentration	-0.142** (0.069)	-0.135** (0.058)		
job connectivity	0.039 (0.034)	0.029 (0.029)		
education 1996	0.102*** (0.037)	0.133*** (0.031)	0.118*** (0.034)	0.154*** (0.034)
log employment 1996	-0.049 (0.043)	-0.017 (0.027)	0.020 (0.025)	0.025 (0.019)
log wage 1996	-0.326*** (0.113)	-0.285*** (0.091)	-0.326*** (0.102)	-0.333*** (0.093)
constant	3.078*** (0.966)	2.276*** (0.720)	2.373** (0.880)	2.390*** (0.717)
Observations	36	36	36	36
R-squared	0.364	0.472	0.270	0.411

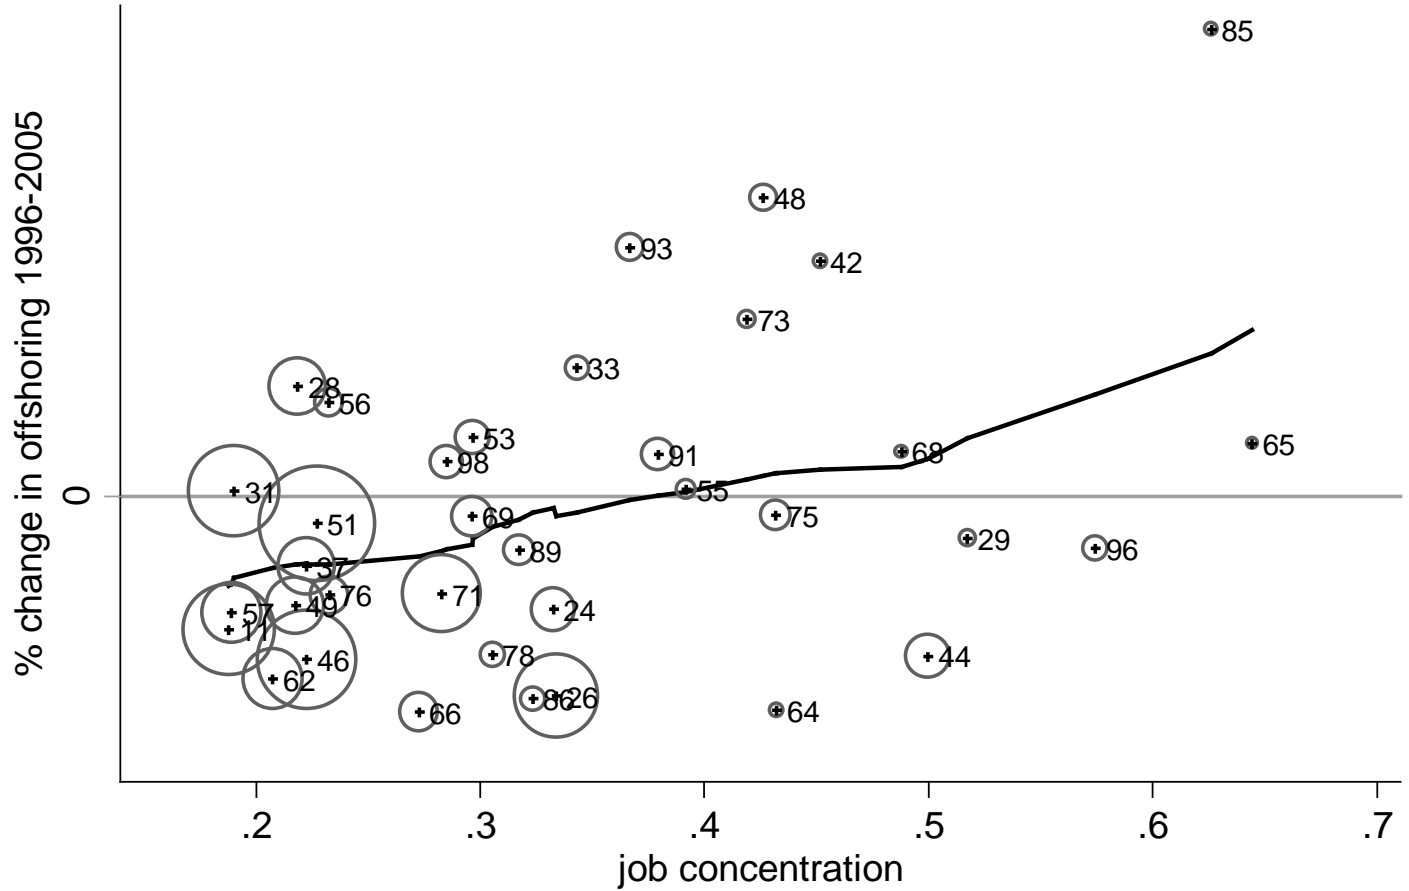

Predicted and actual changes

Offshoring

- Contestable tasks are
 - ▶ Unconnected
 - ▶ Concentrated

Offshoring

Offshoring

Offshoring

Dependent variable: Changes in offshoring, 1996-2005	(1) OLS	(2) OLS	(3) OLS	(4) WLS
job concentration	0.059** (0.025)		0.060** (0.023)	0.029 (0.023)
job connectivity		-0.020 (0.015)	-0.021 (0.013)	-0.005 (0.012)
offshoring 1996	-0.023* (0.012)	-0.014 (0.085)	-0.023* (0.011)	-0.022** (0.010)
constant	0.024* (0.014)	0.017 (0.013)	0.024* (0.013)	0.007 (0.015)
Observations	36	36	36	36
R-squared	0.248	0.090	0.317	0.218

Conclusion

- Trade in tasks effects employment
 - ▶ Framework of workers, firms and space helps understand why some tasks are contested
 - Workers connectivity and price effect
 - Firms connectivity
 - Space connectivity and concentration
 - ▶ Empirical evidence suggests that
 - low connectivity and large wage differentials induce separation

Conclusion

- Will my job be offshored?

- It depends ...
 - ▶ How well connected are the tasks within your job?
 - ▶ How large is the price differential in your job?

 - ▶ When tasks are separated from your job, to what extent will they be outsourced by the firm?

 - ▶ How well connected is your job to other jobs?
 - ▶ How concentrated is your job in space?

cpb

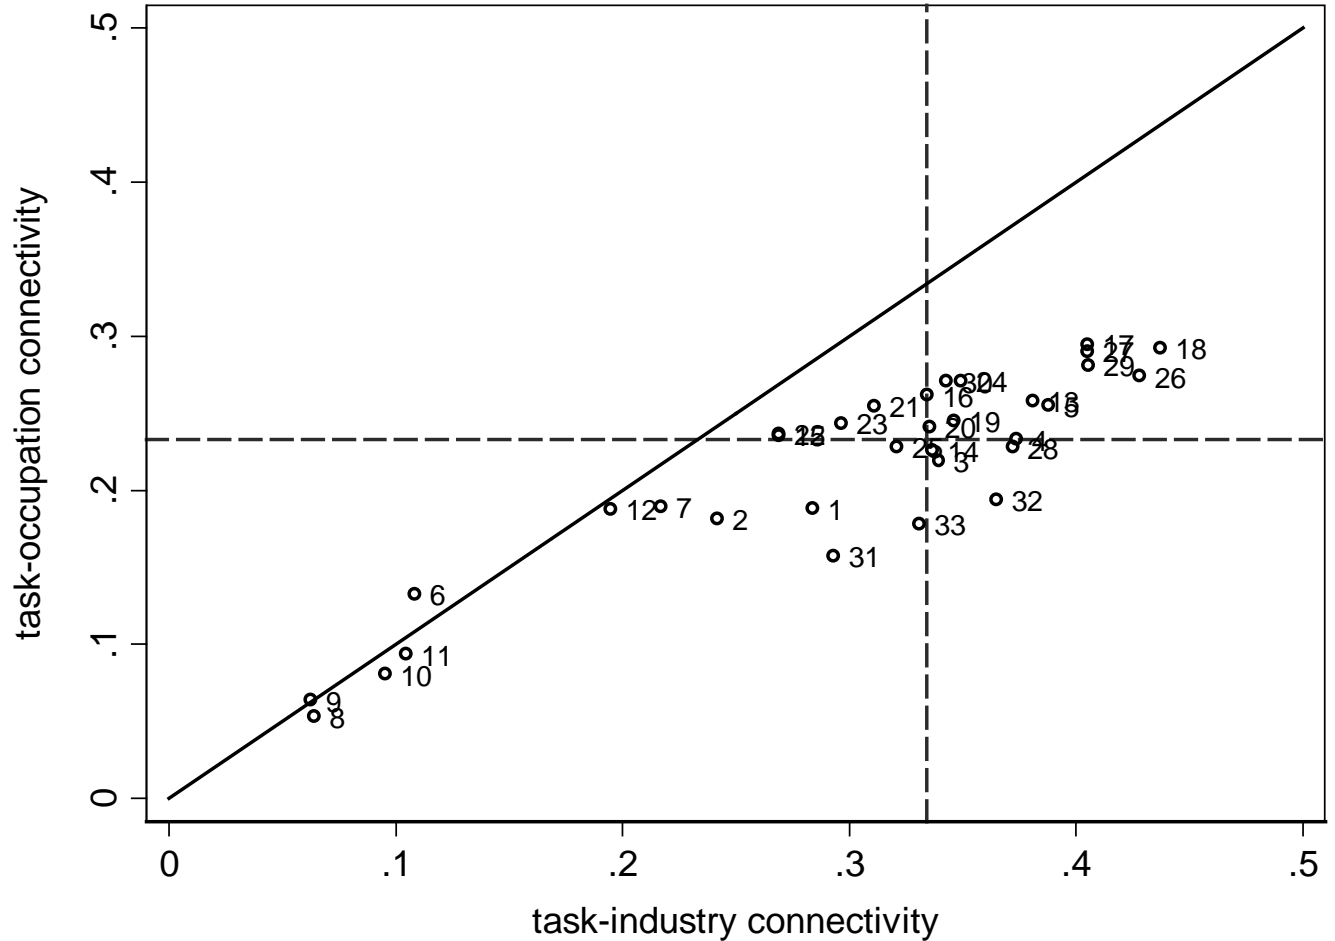

Tasks, technology and trade

Predicted and actual changes by level of education

Tasks are more connected to the industry than the occupation

Predicted and actual changes

Predicted and actual changes by level of education

Job connectivity and employment changes

Job concentration and employment changes

Predicted and actual changes
